

ReplicAlive Molds Care Instructions

Dear Customer.

Thank you for purchasing ReplicAlive molds. Our molds are made of an excellent quality FDA certified food-grade silicone. The silicone is long-lasting and is resistant up to 220 degrees Celsius. Nevertheless, the life of your mold depends on many factors and will be greatly extended with careful handling.
Caring for your molds isn't difficult, but there are a few things to

remember.

- 1. Store your silicone molds in a single, flat layer. Storing them in a pile or packing them tightly in a drawer or shelf may cause them to bend and warp. Once a silicone mold is warped, it cannot be undone. To create more storage space, use a piece of cardboard on top of a layer of molds to create a new storage layer. Be sure to evenly distribute the molds on the next layer.
- 2. Store your silicone molds in a cool, dry area, out of direct sunlight. Silicone breaks down easily in humidity. They start becoming very sticky feeling.
- 3. If you're not going to be using your silicone mold for a while, consider storing a casting, if possible, in the mold to help insure it will retain its shape.
- 4. Do not pierce holes in your mold or expose them to direct flame. This may cause the mold to lose its shape and breaks down faster.
- 5. When finished with your silicone mold, wash it with warm water and mild soap before storing. Do not use solvents to clean your mold and do not place it in the dishwasher. Make sure your molds are completely dry before storing.
- 6. When removing a piece from the mold, be careful to stretch the sides of the mold as gently as possible if not at all.
- 7. Thought the silicone used is resistant to high temperatures, the repetitive use of the mold at these temperatures will shorten its shell life
